## 1 The DOCSTRIP modules

The following modules are used in the implementation to direct DOCSTRIP in generating the external files:

refart produce the document class refart refrep produce the document class refrep driver produce a documentation driver file

## 2 Initial Code

In this part we define a few commands that are used later on.

Optsize This control sequence is used to store the second digit of the pointsize we are

typesetting in. So, normally, its value is one of 0, 1 or 2.

- 1 (\*refart | refrep)
- 2 \newcommand\@ptsize{}

\if@restonecol Only the index is printed in two-column layout.

3 \newif\if@restonecol

\if@titlepage

A switch to indicate if a titlepage has to be produced. For the refart document class the default is not to make a separate titlepage.

- 4 \newif\if@titlepage
- ${\small 5~\langle +refart\rangle \setminus @titlepagefalse}\\$
- $6 \langle +refrep \rangle \backslash @titlepagetrue$

\if@openright

A switch to indicate if chapters must start on a right-hand page. The default for the refrep class is no. There are no chapters in the refart class.

```
7 (+refrep)\newif\if@openright
```

# 3 Declaration of Options

### 3.1 Setting Paper Sizes

The variables \paperwidth and \paperheight should reflect the physical paper size after trimming. For desk printer output this is usually the real paper size since there is no post-processing. Classes for real book production will probably add other paper sizes and additionally the production of crop marks for trimming. Since repbook does not exist you may change the papersizes in your document if needed.

```
8 \DeclareOption{a4paper}
     {\setlength\paperheight {297mm}%
10
      \setlength\paperwidth {210mm}}
11 \DeclareOption{a5paper}
     {\setlength\paperheight {210mm}%
      \setlength\paperwidth {148mm}}
14 \DeclareOption{b5paper}
     {\setlength\paperheight {250mm}%
      \setlength\paperwidth {176mm}}
17 \DeclareOption{letterpaper}
     {\setlength\paperheight {11in}%
      \setlength\paperwidth {8.5in}}
19
20 \DeclareOption{legalpaper}
     {\setlength\paperheight {14in}%
      \setlength\paperwidth {8.5in}}
23 \DeclareOption{executivepaper}
     {\setlength\paperheight {10.5in}%
      \setlength\paperwidth {7.25in}}
```

A new length \papermarginwidth is allocated and set to 1 in. The option smallborder reduces the margin around the document to 0.25 in. This is suitable for documents that are ment to be read on the screen, since it wastes less screen area. It is probably no good idea to use this option for a printed document.

If you want to change this margin use \setlength\papermarginwidth in your document and issue a \settowidth{0.7} command to recalculate the page layouot.

```
26 \newlength\papermarginwidth
27 \setlength\papermarginwidth {1in}
28 \DeclareOption{smallborder}
29 {\setlength\papermarginwidth {0.25in}}
```

The option landscape switches the values of \paperheight and \paperwidth, assuming the dimensions were given for portrait paper.

```
30 \DeclareOption{landscape}
```

```
31 {\setlength\@tempdima {\paperheight}%
32 \setlength\paperheight {\paperwidth}%
33 \setlength\paperwidth {\@tempdima}}
```

The option square assigns the values of \paperwidth to \paperheight, which will result in a square layout. If you use landscape first you will get a square layout which uses the height of your original paper.

```
34 \DeclareOption{square}
35 {\setlength\paperheight {\paperwidth}}
```

## 3.2 Telling the DVI-driver what we know

We know the actual paper size, let's tell the dvi-driver about it. You have to specify the dvi-driver you are using. These three options are compatible to the options of the KOMA-script class, thanks Markus.

```
dvips

36 \DeclareOption{dvips}{\AtBeginDocument{\AtBeginDvi{%}}
37 \special{papersize=\the\paperwidth,\the\paperheight}}}

pdftex

38 \DeclareOption{pdftex}{\AtBeginDocument{%}}
39 \pdfpagewidth=\paperwidth \pdfpageheight=\paperheight}}
```

Since we need to know whether we are generating DVI or PDF we can make this information available to the user as well.

#### \ifpdfoutput

```
40 \newcommand{\ref@ifpdfoutput}[2]{%
    \begingroup\@ifundefined{pdfoutput}{\endgroup #2}{\endgroup%
      \ifnum\pdfoutput>0\relax #1\else #2\fi}}%
43 \@ifundefined{ifpdfoutput}{%
44 \let\ifpdfoutput\ref@ifpdfoutput}{%
45 (*refart)
46 \PackageInfo{refart}
47 (/refart)
48 (*refrep)
49 \PackageInfo{refrep}
50 (/refrep)
      {\string\ifpdfoutput\space already defined.\MessageBreak
51
      If \string\ifpdfoutput\space does not behave like\MessageBreak
52
      is is described at the Refman manual, try find out\MessageBreak
53
      at which package \string\ifpdfoutput\space was defined.}}
```

The option pagesize will export the correct definition for the dvi-driver used. (Unless magic fails, then you need to specify the driver manually.)

#### pagesize

55 \DeclareOption{pagesize}{\AtBeginDocument{%

- 56 \ref@ifpdfoutput
- 57 {\pdfpagewidth=\paperwidth\pdfpageheight=\paperheight}
- 58 {\AtBeginDvi{\special{papersize=\the\paperwidth,\the\paperheight}}}}}

#### 3.3 Choosing the type size

The type size options are handled by defining \@ptsize to contain the last digit of the size in question and branching on \ifcase statements. This is done for historical reasons, to stay compatible with other packages that use the \@ptsize variable to select special actions. It makes the declarations of size options less than 10pt difficult, although one can probably use 8 assuming that a class won't define both 8pt and 18pt options.

```
59 \DeclareOption{10pt}{\renewcommand\@ptsize{0}}
60 \DeclareOption{11pt}{\renewcommand\@ptsize{1}}
61 \DeclareOption{12pt}{\renewcommand\@ptsize{2}}
```

#### 3.4 Two-side or one-side printing

For two-sided printing we use the switch \if@twoside. We set \if@mparswitch which does nothing now but is kept for compatibility reasons.

```
62 \DeclareOption{oneside}{\@twosidefalse \@mparswitchfalse}
63 \DeclareOption{twoside}{\@twosidetrue \@mparswitchtrue}
```

## 3.5 Draft option

If the user requests draft we show any overfull boxes. We could probably add some more interesting stuff to this option.

#### 3.6 Titlepage option

The refart usually has no separate titlepage, but the user can request one.

```
66 \DeclareOption{titlepage} {\@titlepagetrue} 67 \DeclareOption{notitlepage}{\@titlepagefalse}
```

#### 3.7 openright option

This option determines whether or not a chapter must start on a right-hand page and request one.

## 3.8 Twocolumn printing

Two-column is used in the index. There is no user command or option to request two-column printing. Therefore twocolumn will lead to an error message.

```
70 \DeclareOption{onecolumn}{\Qtwocolumnfalse}
71 \DeclareOption{twocolumn}{%
72 \langle +refrep \ \ClassError{Refart}
73 \langle +refrep \ \ClassError{Refrep}
74 \ {There is no twocolumn layout in this class!}
75 \ {Can you imagine how twocolumn layout will look\MessageBreak
76 in this class? That's why!}
77 \ \Qtwocolumnfalse}
```

## 3.9 Equation numbering on the left

The option lequo can be used to get the equation numbers on the left side of the equation.

78 \DeclareOption{leqno}{\input{leqno.clo}}

#### 3.10 Flush left displays

The option fleqn redefines the displayed math environmens in such a way that they come out flush left, with an indentation of \mathindent from the prevailing left margin.

79 \DeclareOption{fleqn}{\input{fleqn.clo}}

## 3.11 Open bibliography

The option openbib produces the "open" bibliography style, in which each block starts on a new line, and succeeding lines in a block are indented by \bibindent. 80 \DeclareOption{openbib}{%

First some hook into the bibliography environment is filled.

```
81  \AtEndOfClass{%
82  \renewcommand\@openbib@code{%
83    \advance\leftmargin\bibindent
84    \itemindent -\bibindent
85    \listparindent \itemindent
86    \parsep \z0
87    }%
In addition the definition of \newblock is overwritten.
88  \renewcommand\newblock{\par}}%
89 }
```

## 3.12 User flags

There are some flags the user may change to control the behaviour of some commands:

\ifdescriptioncolon

This switch controls whether there is a colon in the description item or not. The default is to include a colon.

90 \newif\ifdescriptioncolon \descriptioncolontrue

\ifdescriptionleft

This switch controls whether the description items are set left bound or right bound. The default is right bound.

91 \newif\ifdescriptionleft \descriptionleftfalse

\ifmaxipagerule

This switch controls whether there is a rule at the beginning and end of a maxipage. This flag may later be used to select rules at other places (like part or chapter) as well.

92 \newif\ifmaxipagerule \maxipageruletrue

# 4 Executing Options

Here we execute the default options to initialize certain variables.

```

```

The \ProcessOptions command causes the execution of the code for every option FOO which is declared and for which the user typed the FOO option in his \documentclass command. For every option BAR he typed, which is not declared, the option is assumed to be a global option. All options will be passed as document options to any \usepackage command in the document preamble.

#### 99 \ProcessOptions

Now that all the options have been executed we can load the chosen class option file that contains all size dependent-code. We are using the sizexx.clo Files from classes.dtx now and do the page layout caculation inside the class-file.

```
100 (*refart | refrep)
101 \input{size1\@ptsize.clo}
102 (/refart | refrep)
```

# 5 Loading Packages

The standard class files do not load additional packages.

#### 6 Document Layout

In this section we are finally dealing with the nasty typographical details.

#### 6.1**Fonts**

LATEX offers the user commands to change the size of the font, relative to the 'main' size. Each relative size changing command \size executes the command  $\colonermal{Cont-size} \langle baselineskip \rangle$  where:

 $\langle font\text{-}size \rangle$  The absolute size of the font to use from now on.

 $\langle baselineskip \rangle$  The normal value of \baselineskip for the size of the font selected. (The actual value will be \baselinestretch \* \langle baselineskip \rangle.)

A number of commands, defined in the LATEX kernel, shorten the following definitions and are used throughout. They are:

| \@vpt    | 5     | \@vipt  | 6  | \@viipt | 7    |
|----------|-------|---------|----|---------|------|
| \@viiipt | 8     | \@ixpt  | 9  | \@xpt   | 10   |
| \@xipt   | 10.95 | \@xiipt | 12 | \@xivpt | 14.4 |

\@normalsize

\normalsize The user level command for the main size is \normalsize. Internally, LATEX uses \@normalsize when it refers to the main size. \@normalsize will be defined to work like \normalsize if the latter is redefined from its default definition (that just issues an error message). Otherwise \@normalsize simply selects a 10pt/12pt size.

See classes.dtx for documentaion on sizexx.clo

#### 6.2 **Paragraphing**

\normallineskip together.

\lineskip These parameters control TFX's behaviour when two lines tend to come too close

```
103 (*refart | refrep)
```

104 \setlength\lineskip{1\p0}

105 \setlength\normallineskip{1\p0}

\baselinestretch

This is used as a multiplier for \baselineskip. The default is to not stretch the

106 \renewcommand\baselinestretch{}

\parindent

\parskip \parskip gives extra vertical space between paragraphs and \parindent is the width of the paragraph indentation. The value of \parindent is set to 0.

```
107 \setlength\parskip
                       {0.5\baselineskip \@plus 2\p@}
108 \setlength\parindent \{\z0\}
```

The commands \nopagebreak and \nolinebreak put in penalties to discourage \@lowpenalty \@medpenalty these breaks at the point they are put in. They use \@lowpenalty, \@medpenalty or \@highpenalty, dependent on their argument. \@highpenalty

> 109 \@lowpenalty 51 110 \@medpenalty 151 111 \@highpenalty 301

These penalties are use to discourage club and widow lines. Because we use their \clubpenalty \widowpenalty default values we only show them here, commented out.

> 112 % \clubpenalty 150 113 % \widowpenalty 150

\displaywidowpenalty Discourrage (but not so much) widows in front of a math display and forbid \predisplaypenalty breaking directly in front of a display. Allow break after a display without a \postdisplaypenalty penalty. Again the default values are used, therefore we only show them here.

> 114 % \displaywidowpenalty 50 115 % \predisplaypenalty 116 % \postdisplaypenalty 0

\interlinepenalty Allow the breaking of a page in the middle of a paragraph.

117 % \interlinepenalty 0

\brokenpenalty We allow the breaking of a page after a hyphenated line.

118 % \brokenpenalty 100

#### Page Layout 6.3

All margin dimensions are measured from a point one inch from the top and lefthand side of the page.

#### 6.3.1Vertical spacing

\headheight \headsep \topskip

The \headheight is the height of the box that will contain the running head. The \headsep is the distance between the bottom of the running head and the top of the text. \topskip is the \baselineskip for the first line on a page. Only the definition of \headsep differs from sizexx and has to be changed.

119 \setlength\headsep {\baselineskip}

#### 6.3.2 The dimension of text

\textwidth \leftmarginwidth

\fullwidth There is no need to supply a compatibility mode since the independent refman.sty was never released to the public.

We will set the dimensions differently, taking into account the paper size for

First, we calculate the maximum text width, which will fit on the selected paper and store it in \@tempdima.

120 \newdimen\leftmarginwidth

121 \newdimen\fullwidth

\emptyheadtopmargin

\emptyfoottopmargin Your document uses either footings or headings. Depending on this, the whole page is shifted up or down by one line.

```
122 \newdimen\emptyfoottopmargin
123 \ \mbox{newdimen}\mbox{\em}
```

\settextfraction

You can specify how much of the \fullwidth will be used for the text by using the \settextfraction command. The argument should be between 0 and 1. The remaining width is used for the left margin. This command recalculates the page layout. You have to call \settextfraction with the default value of 0.7 to adjust the layout when you want to change the \papermarginwidth.

```
124 \newcommand\settextfraction[1]%
125 {
     \setlength\fullwidth{\paperwidth}
126
     \addtolength\fullwidth{-2\papermarginwidth}
127
     \@settopoint\fullwidth
128
```

Now we can set the \textwidth, depending on whether we will be setting one or two columns.

```
129
     \if@twocolumn
130
          \setlength\textwidth{\fullwidth}
131
          \setlength\textwidth{#1\fullwidth}
132
     \fi
133
```

Here we modify the width of the text a little to be a whole number of points and calculate the remaining margin.

```
\@settopoint\textwidth
134
135
     \setlength\leftmarginwidth{\fullwidth}
     \addtolength\leftmarginwidth{-\textwidth}
136
```

## 6.3.3 Horizontal margins

\oddsidemargin \evensidemargin \marginparwidth The values for \oddsidemargin and \marginparwidth will be set independing on the status of the \if@twoside. (We have the same layout on odd and even pages.)

The \oddsidemargin is simply the \papermargin width plus the \leftmargin width calculated earlier, adjusted by 1 in for the printer driver offset and rounded to full points.

```
137
     \setlength\oddsidemargin
                                   {-1in}
138
     \addtolength\oddsidemargin
                                   {\papermarginwidth}
139
     \addtolength\oddsidemargin
                                   {\leftmarginwidth}
140
     \@settopoint\oddsidemargin
```

Then \evensidemargin and \marginparwidth are set to \oddsidemargin. \marginparwidth will be modified later.

```
\setlength\evensidemargin {\oddsidemargin}
141
142
     \setlength\marginparwidth {\leftmarginwidth
    }
143
```

\marginparsep \marginparpush The horizontal space between the main text and marginal notes is determined by \marginparsep (defined in sizexx), the minimum vertical separation between two marginal notes is controlled by \marginparpush which is set to 0 because we will have lots of margin notes. The width of the marginpar is reduced by marginparsep to produce flush left pages.

```
144 \addtolength\marginparwidth {-\marginparsep}
145 \setlength\marginparpush {0\p@}
146 }
```

Now we call \settextfraction with the default value of 0.7

```
147 \@onlypreamble\settextfraction
148 \settextfraction {0.7}
```

\textheight

Now that we have computed the width of the text, we have to take care of the height. The \textheight is the height of text (including footnotes and figures, excluding running head and foot).

Again we compute this, depending on the papersize and depending on the baselineskip that is used, in order to have a whole number of lines on the page.

```
149 \setlength\@tempdima {\paperheight}
```

We leave at least a \papermarginwidth margin on the top and the bottom of the page.

```
150 \addtolength\@tempdima{-2\papermarginwidth}
```

The running headers and footers extend partly into the top and bottom margins.

```
151 \addtolength\@tempdima{-.5in}
```

Then we divide the result by the current \baselineskip and store this in the count register \@tempcnta, which then contains the number of lines that fit on this page.

```
152 \divide\@tempdima\baselineskip
153 \@tempcnta=\@tempdima
```

From this we can calculate the height of the text.

154 \setlength\textheight{\@tempcnta\baselineskip}

The first line on the page has a height of \topskip.

155 \advance\textheight by \topskip

#### 6.3.4 Vertical margins

\topmargin

The \topmargin is the distance between the top of 'the printable area' —which is 1 inch below the top of the paper— and the top of the box which contains the running head.

It can now be computed from the values set above and rounded to full points.

```
156 \setlength\topmargin {\paperheight}
157 \addtolength\topmargin{-\headheight}
158 \addtolength\topmargin{-\headsep}
```

```
159 \addtolength\topmargin{-\textheight}
160 \addtolength\topmargin{-\footskip} % this might be wrong!
161 \addtolength\topmargin{-.5\topmargin}
162 \addtolength\topmargin{-1in}
163 \@settopoint\topmargin
```

By changing the factor in the next line the complete page can be shifted vertically. The contents of the page is shifted up or down by one **\baselineskip** depending on the pagestyle. Do not combine headings and footings in one document!

```
164 \setlength\emptyfoottopmargin {\topmargin}
165 \addtolength\emptyfoottopmargin{\baselineskip}
166 \setlength\emptyheadtopmargin {\topmargin}
167 \addtolength\emptyheadtopmargin{-\baselineskip}
```

#### 6.3.5 Float placement parameters

All float parameters are given default values in the LaTeX  $2_{\varepsilon}$  kernel. For this reason counters only need to be set with \setcounter and other parameters are set using \renewcommand.

#### Limits for the placement of floating objects

\colonumber The topnumber counter holds the maximum number of floats that can appear on the top of a text page.

168 \setcounter{topnumber} {2}

\topfraction This indicates the maximum part of a text page that can be occupied by floats at the top.

169 \renewcommand\topfraction {.7}

\colored \co

170 \setcounter{bottomnumber} {1}

\bottomfraction This indicates the maximum part of a text page that can be occupied by floats at the bottom.

171 \renewcommand\bottomfraction{.3}

\c@totalnumber This indicates the maximum number of floats that can appear on any text page.

172 \setcounter{totalnumber} {3}

\textfraction This indicates the minimum part of a text page that has to be occupied by text.

173 \renewcommand\textfraction{.2}

\floatpagefraction This indicates the minimum part of a page that has to be occupied by floating objects before a 'float page' is produced.

174 \renewcommand\floatpagefraction{.5}

\c@dbltopnumber

The dbltopnumber counter holds the maximum number of two column floats that can appear on the top of a two column text page.

175 \setcounter{dbltopnumber} {2}

\dbltopfraction This indicates the maximum part of a two column text page that can be occupied by two column floats at the top.

176 \renewcommand\dbltopfraction{.7}

\dblfloatpagefraction

This indicates the minimum part of a page that has to be occupied by two column wide floating objects before a 'float page' is produced.

177 \renewcommand\dblfloatpagefraction{.5} 178 (/refart | refrep)

#### Page Styles 6.4

The page style foo is defined by defining the command \ps@foo. This command should make only local definitions. There should be no stray spaces in the definition, since they could lead to mysterious extra spaces in the output (well, that's something that should be always avoided).

\@evenhead \@oddhead \@evenfoot \@oddfoot

The \ps@... command defines the macros \@oddhead, \@oddfoot, \@evenhead, and \@evenfoot to define the running heads and feet—e.g., \@oddhead is the macro to produce the contents of the heading box for odd-numbered pages. It is called inside an \hbox of width \textwidth.

#### Marking conventions

To make headings determined by the sectioning commands, the page style defines the commands \chaptermark, \sectionmark, ..., where \chaptermark $\{\langle TEXT \rangle\}$ is called by \chapter to set a mark, and so on.

The \...mark commands and the \...head macros are defined with the help of the following macros. (All the \...mark commands should be initialized to

LATEX extends TeX's \mark facility by producing two kinds of marks, a 'left' and a 'right' mark, using the following commands:

 $\mathbf{LEFT}$  { $\langle RIGHT \rangle$ }: Adds both marks.

 $\mathsf{Markright}(\langle RIGHT \rangle)$ : Adds a 'right' mark.

\leftmark: Used in the \@oddhead, \@oddfoot, \@evenhead or \@evenfoot macros, it gets the current 'left' mark. \leftmark works like TEX's \botmark

\rightmark: Used in the \@oddhead, \@oddfoot, \@evenhead or \@evenfoot macros, it gets the current 'right' mark. \rightmark works like TEX's \firstmark command.

The marking commands work reasonably well for right marks 'numbered within' left marks-e.g., the left mark is changed by a \chapter command and

the right mark is changed by a \section command. However, it does produce somewhat anomalous results if two \markboth's occur on the same page.

Commands like \tableofcontents that should set the marks in some page styles use a \@mkboth command, which is \let by the pagestyle command (\ps@...) to \markboth for setting the heading or to \@gobbletwo to do nothing.

```
179 % %%%\mark{{}{}} % Initializes TeX's marks <--- can vanish
```

#### 6.4.2 Defining the page styles

The pagestyles empty is defined in latex.dtx.

\ps@plain We have to redefine plain to support twoside layout.

```
180 (*refart | refrep)
181 \if@twoside
     \def\ps@plain{%
182
        \let\@mkboth\@gobbletwo
183
184
        \let\@oddhead\@empty
185
        \let\@evenhead\@empty
        \def\@oddfoot{\normalfont\hfil\thepage}
186
187
        \def\@evenfoot{\normalfont\thepage\hfil}}
188 \else
189
     \def\ps@plain{%
190
       \let\@mkboth\@gobbletwo
191
        \let\@oddhead\@empty
        \let\@evenhead\@empty
192
193
        \def\@oddfoot{\normalfont\hfil\thepage}
194
        \let\@evenfoot\@oddfoot}
195 \fi
196 % \end{macrocode}
197 % \end{macro}
198 %
199 % \begin{macro}{\ps@headings}
         The definition of the page style \pstyle{headings} has to be
200 %
        different for two sided printing than it is for one sided
201 %
202 %
        printing.
203 %
204 %
         \begin{macrocode}
205 \if@twoside
        \def\ps@headings{%
```

The running feet are empty in this page style, the running head contains the page number and one of the marks.

```
207 \let\@oddfoot\@empty\let\@evenfoot\@empty
208 \def\@evenhead{\hss\vbox to \z@{\vss\hsize=\fullwidth
209 \hb@xt@\fullwidth{\thepage\hfil\slshape\leftmark}
210 \vskip 3\p@ \hrule}}%
211 \def\@oddhead{\hss\vbox to \z@{\vss\hsize=\fullwidth
212 \hb@xt@\fullwidth{{\slshape\rightmark}\hfil\thepage}
213 \vskip 3\p@ \hrule}}%
```

When using this page style, the contents of the running head is determined by the chapter and section titles. So we \let \@mkboth to \markboth.

```
1214 \let\@mkboth\markboth
```

We shift the page one **\baselineskip** to the bottom to compensate for the headings.

```
215 \topmargin\emptyfoottopmargin 216 \langle refart \mid refrep \rangle
```

For the refart document class we define \sectionmark to clear the right mark and put the number of the section (when it is numbered) and its title in the left mark. The rightmark is set by \subsectionmark to contain the subsection titles.

Note the use of ##1 for the parameter of the \sectionmark command, which will be defined when \ps@headings is executed.

```
217 (*refart)
          \def\sectionmark##1{%
218
219
            \markboth {\ifnum \c@secnumdepth >\z@
220
                \thesection\quad\fi
221
                ##1}{}}%
222
          \def\subsectionmark##1{%
            \markright {\ifnum \c@secnumdepth >\@ne
223
                \thesubsection\quad\fi
224
                ##1}}}
225
226 (/refart)
```

In the refrep document class we use the \chaptermark and \sectionmark macros to fill the running heads.

Note the use of ##1 for the parameter of the \chaptermark command, which will be defined when \ps@headings is executed.

```
227 (*refrep)
228
          \def\chaptermark##1{%
            \markboth {\ifnum \c@secnumdepth >\m@ne
229
                \@chapapp\ \thechapter \ \fi
230
                ##1}{}}%
231
          \def\sectionmark##1{%
232
            \markright {\ifnum \c@secnumdepth >\z@

                ##1}{}}%
277
          \def\subsectionmark##1{%
278
            \markright {\ifnum \c@secnumdepth >\@ne
279
                \thesubsection\quad\fi
280
                ##1}}}
282 (/refart)
```

In the refrep document class we use the \chaptermark and \sectionmark macros to fill the running heads.

Note the use of ##1 for the parameter of the \chaptermark command, which will be defined when \ps@footings is executed.

```
283 (*refrep)
          \def\chaptermark##1{%
285
            \markboth {\ifnum \c@secnumdepth >\m@ne
286
                \@chapapp\ \thechapter \ \fi
287
                ##1}{}}%
          \def\sectionmark##1{%
288
            \markright {\ifnum \c@secnumdepth >\z@
289
                \thesection \ \fi
290
                ##1}}}
291
292 (/refrep)
```

The definition of  $\ps@footings$  for one sided printing can be much simpler, because we treat even and odd pages the same. Therefore we don't need to define  $\psgrupe \propto \propt$ 

```
293 \*refart | refrep\\
294 \else
295 \def\ps@footings{%}
296 \let\@oddhead\@empty
297 \def\@oddfoot{\hss\vbox to \z@{\vss\hsize=\fullwidth}
298 \hrule \vskip 3\p@
299 \hb@xt@\fullwidth{{\slshape\rightmark}\hfil\thepage}}}%
300 \let\@mkboth\markboth
```

We shift the page one \baselineskip to the top to compensate for the footings.

```
301 \topmargin\emptyheadtopmargin 302 \; \langle / \text{refart} \mid \text{refrep} \rangle
```

We use \markright now instead of \markboth as we did for two sided printing.

```
303 \*refart\\
304 \def\sectionmark##1{%}
305 \markright {\ifnum \c@secnumdepth >\m@ne}
306 \thesection\quad\fi
307 ##1}}
```

```
308 \( /refart \)
309 \( \sqrt{efart} \)
310 \( \def \chaptermark ##1 \) \\
311 \markright \{\ifnum \c@secnumdepth > \m@ne \)
312 \@chapapp \\thechapter \\fi \)
313 \\
314 \( /refrep \)
315 \( \sqrt{efart} \| refrep \)
316 \\ \fi \)
```

\ps@myheadings

The definition of the page style *myheadings* is fairly simple because the user determines the contents of the running head himself by using the \markboth and \markright commands.

```
317 \def\ps@myheadings{%
318 \let\@oddfoot\@empty\let\@evenfoot\@empty
319 \def\@evenhead{\hss\vbox to \z@{\vss\hsize=\fullwidth

336 \def\@oddfoot{\hss\vbox to \z@{\vss\hsize=\fullwidth
337 \hrule \vskip 3\p@
338 \hb@xt@\fullwidth{{\slshape\rightmark}\hfil\thepage}}}%
```

We have to make sure that the marking commands that are used by the chapter and section footings are disabled. We do this \lefting them to a macro that gobbles its argument(s).

```
339 \let\@mkboth\@gobbletwo
340 \refrep\ \let\chaptermark\@gobble
341 \let\sectionmark\@gobble
342 \refart\ \let\subsectionmark\@gobble
We shift the page one \baselineskip to the top to compensate for the footings.
343 \topmargin\emptyheadtopmargin
344 }
```

## 7 Document Markup

#### 7.1 The title

\title \author \date These three macros are provided by latex.dtx to provide information about the title, author(s) and date of the document. The information is stored away in internal control sequences. It is the task of the \maketitle command to use the information provided. The definitions of these macros are shown here for information.

```
345 % \newcommand*{\title}[1]{\gdef\@title{#1}}
346 % \newcommand*{\author}[1]{\gdef\@author{#1}}
347 % \newcommand*{\date}[1]{\gdef\@date{#1}}
The \date macro gets today's date by default.
348 % \gdef\@date{\today}
```

\maketitle

The definition of \maketitle depends on whether a separate title page is made. This is the default for refrep. If you want a titlepage with refart you can enable it using the titlepage option.

When we are making a title page, we locally redefine \footnotesize and footnoterule to change the appearance of the footnotes that are produced by the \thanks command.

```
349 \if@titlepage
     \verb|\newcommand| maketitle{\begin{titlepage}}|%
350
351
      \let\footnotesize\small
352
     \let\footnoterule\relax
     \let\footnote\thanks
353
      \renewcommand\thefootnote{\@fnsymbol\c@footnote}%
354
      \def\@makefnmark%
355
          {\rlap{\@textsuperscript{\normalfont\@thefnmark}}}%
356
      \long\def\@makefntext##1{%
357
           \@setpar{\@@par
358
              \@tempdima = \hsize
359
              \advance\@tempdima -1em
360
361
              \parshape \@ne 1em \@tempdima}%
362
           \par\parindent 1em \noindent
```

We center the entire title vertically; the centering is set off a little by adding a \wskip. In compatibility mode the page number is set to 0 to keep the behaviour of IATEX 2.09 style files

```
364 \null\vfil
365 \vskip 60\p@
```

Then we set the title, in a **\LARGE** font; leave a little space and set the author(s) in a **\large** font. We do this inside a tabular environment to get them in a single column. Before the date we leave a little whitespace again.

```
\begin{center}%
366
       {\LARGE \@title \par}%
367
        \vskip 3em%
368
       {\large
369
         \lineskip .75em%
370
          \begin{tabular}[t]{c}%
371
372
            \@author
373
          \end{tabular}\par}%
374
          \vskip 1.5em%
375
       {\large \@date \par}%
                                     % Set date in \large size.
     \end{center}\par
```

Then we call **\Othanks** to print the information that goes into the footnote and finish the page.

```
377 \Othanks
378 \vfil\null
379 \end{titlepage}%
```

We reset the footnote counter, disable \thanks and \maketitle and save some storage space by emptying the internal information macros.

```
380 \setcounter{footnote}{0}%
381 \global\let\thanks\relax
382 \global\let\maketitle\relax
383 \global\let\@thanks\@empty
384 \global\let\@author\@empty
385 \global\let\@date\@empty
386 \global\let\@title\@empty
```

After the title is set the declaration commands \title, etc. can vanish. The definition of \and makes only sense within the argument of \author so this can go as well.

```
387 \global\let\title\relax
388 \global\let\author\relax
389 \global\let\date\relax
390 \global\let\and\relax
391 }
```

When the title is not on a page of its own, the layout of the title is a little different. We use symbols to mark the footnotes and we have to deal with two column documents.

Therefore we first start a new group to keep changes local. Then we redefine \thefootnote to use \fnsymbol; and change \@makefnmark so that footnotemarks have zero width (to make the centering of the author names look better).

```
392 \else
                                                           \newcommand\maketitle{\par
393
                                                                               \begingroup
394

   401
                                                                                                                                                                          \advance\@tempdima -1em
                                                                                                                                                                          \parshape \@ne 1em \@tempdima}%
   402
                                                                                                                                       \par\parindent 1em \noindent
403
                                                                                                                                       \label{local_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continu
 404
```

If this is a two-column document we start a new page in two-column mode, with the title set to the full width of the text. The actual printing of the title information is left to \@maketitle.

```
405 \if@twocolumn
406 \ifnum \col@number=\@ne
407 \@maketitle
408 \else
409 \twocolumn[\@maketitle]%
410 \fi
411 \else
```

When this is not a two-column document we just start a new page, prevent floating objects from appearing on the top of this page and print the title information.

```
412 \newpage
413 \global\@topnum\z@ % Prevents figures from going at top of page.
414 \@maketitle
415 \fi
```

This page gets a empty layout. We call \Othanks to produce the footnotes.

```
116 \thispagestyle{empty}\@thanks
```

Now we can close the group, reset the *footnote* counter, disable \thanks, \maketitle and \@maketitle and save some storage space by emptying the internal information macros.

```

## 7.2 Chapters and Sections

#### 7.2.1 Building blocks

The definitions in this part of the class file make use of two macros, \@startsection and \secdef, which are defined by latex.dtx. They are not described here, see the classes.dtx for more information.

#### 7.2.2 Mark commands

\chaptermark \sectionmark \subsectionmark \subsubsectionmark

\chaptermark Default initializations of \...mark commands. These commands are used in the \sectionmark definition of the page styles (see section 6.4.2) Most of them are already defined by latex.dtx, so they are only shown here.

```
\subsubsectionmark by latex.dtx, so they are only shown here
\subsubsectionmark 448 \langle +refrep \newcommand*\chaptermark[1]\{\}
\paragraphmark 449 % \newcommand*\subsectionmark[1]\{\}
\subparagraphmark 450 % \newcommand*\subsectionmark[1]\{\}
451 % \newcommand*\subsectionmark[1]\{\}
452 % \newcommand*\paragraphmark[1]\{\}
453 % \newcommand*\subparagraphmark[1]\{\}
```

#### 7.2.3 Define Counters

```
The value of the counter secnumdepth gives the depth of the highest-level sectioning
   \c@secnumdepth
                     command that is to produce section numbers.
                    454 (+refart)\setcounter{secnumdepth}{3}
                    455 \langle +refrep \rangle \setminus setcounter\{secnumdepth\}\{2\}
                    These counters are used for the section numbers. The macro \mbox{\ensuremath{\text{newcounter}}} \{\nbox{\ensuremath{\text{electro}}}\} [\nbox{\ensuremath{\text{oldetr}}}]
           \c@part
                    defines \langle newctr \rangle to be a counter, which is reset to zero when counter \langle oldctr \rangle is
        \c@chapter
                    stepped. Counter \langle oldctr \rangle must already be defined.
        \c@section
    \c@subsection
                    456 \newcounter {part}
 \c@subsubsection _{457} \+refart\\newcounter {section}}
     \c@paragraph _{458} \langle *refrep \rangle
  \c@subparagraph 459 \newcounter {chapter}
                    460 \newcounter {section}[chapter]
                    461 (/refrep)
                    462 \newcounter {subsection}[section]
                    463 \newcounter {subsubsection}[subsection]
                    464 \newcounter {paragraph}[subsubsection]
                    465 \newcounter {subparagraph}[paragraph]
                    For any counter CTR, \theCTR is a macro that defines the printed version of
      \thechapter
                     counter CTR. It is defined in terms of the following macros:
                         \arabic{COUNTER} prints the value of COUNTER as an arabic numeral.
      \thesection
                         \roman{COUNTER} prints the value of COUNTER as a lowercase roman num-
   \thesubsection
\thesubsubsection
    \theparagraph
                         \Roman{COUNTER} prints the value of COUNTER as an uppercase roman
                    numberal.
\thesubparagraph
                         \alph{COUNTER} prints the value of COUNTER as a lowercase letter: 1 = a,
                     2 = b, etc.
                         \Alph{COUNTER} prints the value of COUNTER as an uppercase letter:
                     1 = A, 2 = B, etc.
                    466 \renewcommand\thepart
                                                          {\@Roman\c@part}
                    467 (+refart)\renewcommand\thesection
                                                                   {\@arabic\c@section}
                    468 (*refrep)
                    469 \renewcommand\thechapter
                                                           {\@arabic\c@chapter}
                    470 \renewcommand\thesection
                                                           {\thechapter.\@arabic\c@section}
                    471 (/refrep)
                    472 \renewcommand\thesubsection
                                                           {\thesection.\@arabic\c@subsection}
                    473 \renewcommand\thesubsubsection {\thesubsection .\@arabic\c@subsubsection}
                    474 \renewcommand\theparagraph
                                                           {\thesubsubsection.\@arabic\c@paragraph}
                    475 \renewcommand\thesubparagraph {\theparagraph.\@arabic\c@subparagraph}
                    \@chapapp is initially defined to be empty. The \appendix command redefines it
        \@chapapp
                     to be '\appendixname'.
                    476 \langle +refrep \rangle \newcommand \chapapp{}
```

#### **7.2.4** Parts

\part The command to start a new part of our document.

In the refart class the definition of \part is rather simple; we start a new paragraph, add a little whitespace, suppress the indentation of the first paragraph and make use of \@secdef. As in other sectioning commands (cf. \@startsection in the IATEX  $2_{\varepsilon}$  kernel), we need to check the @noskipsec switch and force horizontal mode if it is set.

```
477 \( *refart \)
478 \( \text{newcommand \part \}\)
479 \( \text{if @noskipsec \leavevmode \fi} \)
480 \( \par \)
481 \( \addvspace \{4ex \}\)
482 \( \@afterindentfalse \)
483 \( \secdef \@part \@spart \}
484 \( \/ \refart \)
```

For the refrep class things are a bit different.

We start a new (righthand) page and use the empty.

```
485 (*refrep)
486 \newcommand\part{%
487 \if@openright
488 \cleardoublepage
489 \else
490 \clearpage
491 \fi
492 \thispagestyle{empty}%
```

When we are making a two column document, this will be a one column page. We use @tempswa to remember to switch back to two columns.

```
493 \if@twocolumn
494 \onecolumn
495 \@tempswatrue
496 \else
497 \@tempswafalse
498 \fi
```

We need an empty box to prevent the fill glue from disappearing.

```
499 \null\vfil
```

Here we use \secdef to indicate which commands to use to make the actual heading.

```
500 \qquad \qquad \texttt{\secdef\Qpart\Qspart\} \\ 501 \ \texttt{\scdf\Qpart\Qspart\} \\
```

Cpart This macro does the actual formatting of the title of the part. Again the macro is differently defined for the refart document class than for the document class refrep.

When secnumdepth is larger than -1 for the document class refart or -2 for the document class refrep, we have a numbered part, otherwise it is unnumbered.

We print the title flush left, we also prevent breaking between lines and reset the font.

```
511 \longrule\medskip
512 {\parindent \z@ \raggedright
513 \interlinepenalty \@M
514 \normalfont
```

When this is a numbered part we have to print the number and the title. The \nobreak should prevent a page break here.

```
515 \Large  
516 \langle + refart \rangle \ifnum \c@secnumdepth >\m@ne  
517 \langle + refrep \rangle \ifnum \c@secnumdepth >-2 \relax  
518 \thepart.\quad  
519 \fi  
520 #2\par \medskip  
521 \longrule\bigskip%
```

Then we empty the mark registers, leave some whitespace and call **\@afterheading** to takes care of suppressing the indentation.

```
\begin{array}{lll} 522 & \mathbb{F}_{22} \\ 523 & \mathbb{F}_{23} \\ 524 & \mathbb{F}_{24} \\ 525 & \mathbb{F}_{25} \\ 526 & \mathbb{F}_{25} \\ \end{array}
```

\Ospart This macro does the actual formatting of the title of the part when the star form of the user command was used. In this case we never print a number. Otherwise the formatting is the same.

```
527 (*refart | refrep)
528 \def\@spart#1{%
        \longrule\medskip
529
        {\parindent \z@ \raggedright
530
         \interlinepenalty \@M
531
532
         \normalfont
533
         \Large #1\par}%
        \medskip\longrule
534
         \nobreak
535
536
         \vskip 3ex
537
         \@afterheading}
538 (/refart | refrep)
```

#### 7.2.5 Chapters

\chapter A chapter should always start on a new page therefore we start by calling \clearpage and setting the pagestyle for this page to plain.

```
539 (*retrep)
540 \newcommand\chapter{\if@openright\cleardoublepage\else\clearpage\fi
541 \if@pageperchapter\setcounter{page}{1}\fi
542 \thispagestyle{empty}%
```

Then we prevent floats from appearing at the top of this page because it looks weird to see a floating object above a chapter title.

```
543 \global\@topnum\z@
```

Then we suppress the indentation of the first paragraph by setting the switch \@afterindent to false. We use \secdef to specify the macros to use for actually setting the chapter title.

```
544 \@afterindentfalse
545 \secdef\@chapter\@schapter}
```

\@chapter

This macro is called when we have a numbered chapter. When secnumdepth is larger than -1 we display the chapter number. We also inform the user that a new chapter is about to be typeset by writing a message to the terminal.

After having written an entry to the table of contents we store the (alternative) title of this chapter with \chaptermark and add some whitespace to the lists of figures and tables.

```
554 \chaptermark{#1}%
555 \addtocontents{lof}{\protect\addvspace{10\p@}}%
556 \addtocontents{lot}{\protect\addvspace{10\p@}}%
```

Then we call upon \@makechapterhead to format the actual chapter title. We have to do this in a special way when we are in two-column mode in order to have the chapter title use the entire \textwidth. In one column mode we call \@afterheading which takes care of suppressing the indentation.

```
      557
      \if@twocolumn

      558
      \@topnewpage[\@makechapterhead{#2}]%

      559
      \else

      560
      \@makechapterhead{#2}%

      561
      \@afterheading

      562
      \fi}
```

**\@makechapterhead** 

The macro above uses  $\mbox{\@makechapterhead}\mbox{\/}(text)$  to format the heading of the chapter.

We begin by leaving some whitespace. The we open a group in which we have a paragraph indent of 0pt, and in which we have the text set ragged right. We also reset the font.

```
563 \def\@makechapterhead#1{%

564 \longthickrule\bigskip%

565 {\parindent \z@ \secshape \normalfont \Large\bfseries
```

Then we check whether the number of the chapter has to be printed. If so we leave some whitespace between the chapternumber and its title.

```
566 \@hangfrom{\ifnum \c@secnumdepth >\m@ne
567 \@chapapp\space \thechapter\quad
568 \fi}%
```

Now we set the title in a large bold font. We prevent a page break at this point and leave some whitespace before the text begins.

```
569 #1\par}
570 \bigskip\longthickrule\bigskip
571 }
```

\@schapter

This macro is called when we have an unnumbered chapter. It is much simpler than \@chapter because it only needs to typeset the chapter title.

```
572 \def\@schapter#1{\if@twocolumn
573 \@topnewpage[\@makeschapterhead{#1}]%
574 \else
575 \@makeschapterhead{#1}%
576 \@afterheading
577 \fi}
```

**\@makeschapterhead** 

The macro above uses  $\mbox{@makeschapterhead}\langle text\rangle$  to format the heading of the chapter. It is similar to  $\mbox{@makechapterhead}$  except that it never has to print a chapter number.

```
578 \def\@makeschapterhead#1{%
579 \longthickrule\bigskip%
580 {\parindent \z@\secshape \normalfont
581 \Large \bfseries #1\par}
582 \bigskip\longthickrule\bigskip
583 }
584 \dag{\refrep}
```

#### 7.2.6 Lower level headings

#### \secshape

These commands all make use of \@startsection.

\section This gives a normal heading with whitespace above and below the heading, the title set in \large\bfseries, and no indentation on the first paragraph.

```
{-2ex \@plus -1ex \@minus -.2ex}%
590
                         {0.5ex \@plus .2ex}%
591
                         {\secshape\normalfont\large\bfseries}}
```

\subsection This gives a normal heading with whitespace above and below the heading, the title set in \large\bfseries, and no indentation on the first paragraph.

```
592 \newcommand\subsection{\@startsection{subsection}{2}{\z@}%
                                           \{-1.5ex\ \@plus -.5ex\ \@minus -.2ex\}%
593
                                           {0.5ex \@plus .2ex}%
594
                                          {\secshape\normalfont\normalsize\bfseries}}
595
```

\subsubsection This gives a normal heading with whitespace above and below the heading, the title set in \normalsize\bfseries, and no indentation on the first paragraph.

```
596 \mbox{ } \mbox{newcommand \subsubsection} \cline{2}{\mbox{ction}} \cline
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         {-1.5ex\@plus -.5ex \@minus -.2ex}%
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       {0.5ex \@plus .2ex}%
598
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       {\secshape\normalfont\normalsize\mdseries}}
 599
```

\paragraph This gives a run-in heading with whitespace above and to the right of the heading, the title set in \normalsize\bfseries.

```
600 \newcommand\paragraph{\Qstartsection{paragraph}{4}{\zQ}%
601
                                         {2ex\plus 1ex \plus .2ex}%
602
                                         \{-1em\}\%
603
                                         {\normalfont\normalsize\bfseries}}
```

\subparagraph

This gives an indented run-in heading with whitespace above and to the right of the heading, the title set in \normalsize\bfseries.

```
604 \newcommand\subparagraph{\@startsection{subparagraph}{5}{\parindent}}
605
                                            {2ex \@plus 1ex \@minus .2ex}%
606
                                             \{-1em\}\%
607
                                            {\normalfont\normalsize\bfseries}}
```

#### 7.3 Lists

#### 7.3.1 General List Parameters

The following commands are used to set the default values for the list environment's parameters. See the LATEX manual for an explanation of the meanings of the parameters. Defaults for the list environment are set as follows. First, \rightmargin, \listparindent and \itemindent are set to 0pt. Then, for a Kth level list, the command \@listK is called, where 'K' denotes 'i', ''i', ..., 'vi'. (I.e., \@listiii is called for a third-level list.) By convention, \@listK should set \leftmargin to \leftmarginK.

```
\leftmargin For efficiency, level-one list's values are defined at top level, and \@listi is defined
     \leftmargini
                   to set only \leftmargin.
    \leftmarginii
                      When we are in two column mode some of the margins are set somewhat
   \leftmarginiii smaller.
    \leftmarginv 609
                      \setlength\leftmargini
    \leftmarginvi 610 \else
                       \setlength\leftmargini {2.5em}
                  611
                  612 \fi
                   The following three are calculated so that they are larger than the sum of
                   \labelsep and the width of the default labels (which are '(m)', 'vii.' and 'M.').
                  613 \setlength\leftmarginii {2.2em}
                  614 \setlength\leftmarginiii {1.87em}
                  615 \setlength\leftmarginiv {1.7em}
                  616 \if@twocolumn
                       \setlength\leftmarginv {.5em}
                  617
                  618
                       \setlength\leftmarginvi {.5em}
                  619 \else
                       \setlength\leftmarginv {1em}
                  620
                       \setlength\leftmarginvi {1em}
                  622 \fi
                   Here we set the top level leftmargin.
                  623 \setlength\leftmargin
                                               {\leftmargini}
        \labelsep \labelsep is the distance between the label and the text of an item; \labelwidth
      \labelwidth is the width of the label.
                  624 \setlength \labelsep {.5em}
                  625 \setlength \labelwidth{\leftmargini}
                  626 \addtolength\labelwidth{-\labelsep}
\@beginparpenalty These penalties are inserted before and after a list or paragraph environment.
  \@endparpenalty They are set to a bonus value to encourage page breaking at these points.
    \Citempenalty This penalty is inserted between list items.
                  627 (*refart | refrep)
                  628 \@beginparpenalty -\@lowpenalty
                                        -\@lowpenalty
                  629 \@endparpenalty
                  630 \@itempenalty
                                        -\@lowpenalty
                  631 (/refart | refrep)
          \ClistI \ClistI defines top level and \Clisti values of \leftmargin, \parsep, \topsep,
          \@listi and \itemsep
                  632 (*refart | refrep)
                  633 \def\ClistI{\left\{ \right\} }
                                  \parsep \parskip
                                  \topsep \z@
                  635
                                  \left( itemsep \z 0 \right)

                                                                                                                                                 \parskip
                                                                                                        \parsep
                                      643
                                                                                                                                                \z@}
                                                                                                       \itemsep
                                      644
                                      645 \def\@listiii{\leftmargin\leftmarginiii}
                                                                                                       \labelwidth\leftmarginiii
                                      646
                                      647
                                                                                                       \advance\labelwidth-\labelsep
                                      648
                                                                                                        \topsep
                                                                                                                                                 \z0
                                                                                                                                                 \parskip
                                      649
                                                                                                        \parsep
                                                                                                        \partopsep \z@
                                      650
                                                                                                       \itemsep
                                                                                                                                                \topsep}
                                      651
                                      652 \ensuremath{\mbox{\mbox{offmargin}}} \ensuremath{\mbox{\mbox{\mbox{offmargin}}}} \ensuremath{\mbox{\mbox{offmargin}}} \ensuremath{\mbox{offmargin}} \ensuremath{\mbox{\mbox{offmargin}}} \ensuremath{\mbox{offmargin}}} \ensuremath{\mbox{offmargin}} \ensuremath{\mbox{offmargin}}} \ensuremath{\mbox{offmargin}}} \ensuremath{\mbox{offmargin}} \ensuremath{\mbox{offmargin}}} \ensuremath{\mbox{offmargin}} \ensuremath{\mbox{offmargin}}} \ensuremath{\mbox{offmargin}}} \ensuremath{\mbox{offmargin}}} \ensuremath{\mbox{offmargin}} \ensuremath{\mbox{offmargin}}} \ensuremath{\mbox{offmargin}} \ensuremath{\mbox{offmargin}}} \ensuremath{\mbox{offmargin}} \ensuremath{\mbox{offmargin}}} \ensuremath{\mbox{offmargin}}} \ensuremath{\mbox{offmargin}} \ensuremath{\mbox{offmargin}} \ensuremath{\mbox{offmargin}} \ensuremath{\mbox{offmargin}} \ensuremath{\mbox{offmargin}}} \ensuremath{\mbox{offmargin}} \ensuremath{\mbox{offmargin}} \ensuremath{\mbox{offmargin}} \ensuremath{\mbox{offmargin}} \ensuremath{\mbox{offmargin}} \
                                      653
                                                                                                       \labelwidth\leftmarginiv
                                      654
                                                                                                       \advance\labelwidth-\labelsep}
                                      655 \def\@listv {\leftmargin\leftmarginv
                                                                                                       \labelwidth\leftmarginv
                                      656
                                                                                                       \advance\labelwidth-\labelsep}
                                      657
                                      658 \def\@listvi {\leftmargin\leftmarginvi
                                                                                                        \labelwidth\leftmarginvi
                                      659
                                                                                                        \advance\labelwidth-\labelsep}
                                      661 (*refart | refrep)
```

#### 7.3.2 Enumerate

The enumerate environment uses four counters: enumi, enumii, enumiii and enumiv, where enumN controls the numbering of the Nth level enumeration.

```
\theenumii The counters are already defined in latex.dtx, but their representation is changed here.
\theenumiii 662 \langle *refart | refrep \\
\theenumiv 663 \text{\convex} \text{\conve
```

\p@enumii The expansion of \p@enumN\theenumN defines the output of a \ref command \p@enumiii when referencing an item of the Nth level of an enumerated list. \p@enumiv

```
671 \renewcommand\p@enumii {\theenumi}
672 \renewcommand\p@enumiii {\theenumi(\theenumii)}
673 \renewcommand\p@enumiv {\p@enumiii\theenumiii}
```

#### 7.3.3 Itemize

\labelitemii \labelitemiv dot.

\labelitemi Itemization is controlled by four commands: \labelitemi, \labelitemii, \labelitemiii, and \labelitemiv, which define the labels of the various item-\labelitemiii ization levels: the symbols used are bullet, bold en-dash, asterisk and centred

```
674 \newcommand\labelitemi {\textbullet}
675 \newcommand\labelitemii {\normalfont\bfseries \textendash}
676 \newcommand\labelitemiii{\textasteriskcentered}
677 \newcommand\labelitemiv {\textperiodcentered}
```

#### 7.3.4 Description

description The description environment is defined here – while the itemize and enumerate environments are defined in latex.dtx.

```
678 \newenvironment{description}
679
                    {\left\{ \right\} }
680
                         \labelsep\marginparsep
681
                         \labelwidth\leftmarginwidth
                         \advance\labelwidth by \leftmargin
682
                         \advance\labelwidth by -\labelsep
683
684
                         \let\makelabel\descriptionlabel}}
685
                    {\endlist}
```

\descriptionlabel To change the formatting of the label, you must redefine \descriptionlabel.

```
686 \newcommand*\descriptionlabel[1]{%
687
               \ifdescriptionleft\else \hfil\fi
               \normalfont #1 \ifdescriptioncolon :\fi
688
               \ifdescriptionleft \hfil \fi}
689
```

### Defining new environments

#### 7.4.1Abstract

abstract When we are producing a separate titlepage we also put the abstract on a page of its own. It will be centred vertically on the page.

```
690 \setminus if@titlepage
      \newenvironment{abstract}{%
691
          \titlepage
692
693
          \null\vfil
          \verb|\@beginparpenalty| @lowpenalty|
694
          \begin{center}
695
             \bfseries \abstractname
696
697
             \@endparpenalty\@M
```

```
698 \end{center}}
699 {\par\vfil\null\endtitlepage}
```

When we are not making a separate titlepage—the default for the refart document class—we have to check if we are in twocolumn mode. In that case the abstract is as a \section\*, otherwise the quote environment is used to typeset the abstract.

```
700 \else
     \newenvironment{abstract}{%
701
          \if@twocolumn
702
            \section*{\abstractname}%
703
704
          \else
            \small
705
            \begin{center}%
706
              {\bfseries \abstractname\vspace{-.5em}\vspace{\z0}}%
707
708
            \end{center}%
709
            \quote
          fi
710
          {\if@twocolumn\else\endquote\fi}
711
712 \fi
```

#### **7.4.2** Verse

The verse environment is defined by making clever use of the list environment's parameters. The user types \\ to end a line. This is implemented by \let'ing \\ equal \@centercr.

```
713 \newenvironment{verse}
                   {\let\\=\@centercr
714
                    \list{}{\itemsep
715
                                            \z0
                             \itemindent
                                           -1.5em%
716
717
                             \listparindent\itemindent
718
                             \rightmargin \leftmargin
719
                             \advance\leftmargin 1.5em}%
720
                    \item\relax}
                   {\endlist}
721
```

#### 7.4.3 Quotation

quotation The quotation environment is also defined by making clever use of the list environment's parameters. The lines in the environment are set smaller than \textwidth. The first line of a paragraph inside this environment is indented.

```
722 \newenvironment{quotation}
                      {\left\langle i\right\rangle }_{\left\langle i\right\rangle }
723
                                                     \listparindent
                                  \itemindent
724
                                  \rightmargin
                                                     \leftmargin
725
                                  \parsep
                                                     \z@ \@plus\p@}%
726
                        \item\relax}
727
                       {\endlist}
728
```

#### 7.4.4 Quote

quote The quote environment is like the quotation environment except that paragraphs are not indented.

#### 7.4.5 Example

\example The example environment is a verse environment with tt font which tries to avoid page brakes at the \begin{example}.

```
733 \newenvironment{example}
                     {\@beginparpenalty=\@highpenalty
734
                     \left| \cdot \right| = \left| \cdot \right|
735
                      \list{}{\itemsep
                                                \z@
736
                                \itemindent
                                                -1.5em%
737
                                \listparindent\itemindent
738
                                \rightmargin \leftmargin
739
                                \advance\leftmargin 1.5em}%
740
741
                      \ttfamily
742
                      \item\relax}
743
                     {\endlist}
```

#### 7.4.6 Theorem

This document class does not define its own theorem environments, the defaults supplied by latex.dtx are available.

#### 7.4.7 Titlepage

titlepage

In the normal environments, the titlepage environment does nothing but start and end a page, and inhibit page numbers. It also resets the page number to zero. In two-column style, it still makes a one-column page.

```
\newenvironment{titlepage}
744
                  745
                      \@restonecoltrue\onecolumn
746
                   \else
747
                      \@restonecolfalse\newpage
748
                   \fi
749
                   \thispagestyle{empty}%
750
                   \setcounter{page}\@ne
751
752
                  {\if@restonecol\twocolumn \else \newpage \fi
753
754
                   \if@twoside\else
755
                      \setcounter{page}\@ne
756
                   \fi
                  }
757
```

#### 7.4.8 Appendix

\appendix The \appendix command is not really an environment, it is a macro that makes some changes in the way things are done.

In the article document class the \appendix command must do the following:

- reset the section and subsection counters to zero,
- redefine \thesection to produce alphabetic appendix numbers.

```
758 \*refart\\
759 \newcommand\appendix{\par}
760 \setcounter{section}{0}\%
761 \setcounter{subsection}{0}\%
762 \gdef\thesection{\@Alph\c@section}}
763 \/refart\\
```

In the report and book document classes the **\appendix** command must do the following:

- issue a \newpage if pageperchapter is defined, otherwise the page number would come out wrong.
- reset the chapter and section counters to zero,
- set \@chapapp to \appendixname (for messages),
- redefine the chapter counter to produce appendix numbers,
- possibly redefine the \chapter command if appendix titles and headings are to look different from chapter titles and headings.

```
764 \*refrep\
765 \newcommand\appendix{\par
766 \if@pageperchapter\newpage\fi
767 \setcounter{chapter}{0}%
768 \setcounter{section}{0}%
769 \gdef\@chapapp{\appendixname}%
770 \gdef\thechapter{\@Alph\c@chapter}}
771 \/refrep\
```

#### 7.5 Setting parameters for existing environments

#### 7.5.1 Array and tabular

```
\arraycolsep The columns in an array environment are separated by 2\arraycolsep.

772 \setlength\arraycolsep {5\p@}

\tabcolsep The columns in an tabular environment are separated by 2\tabcolsep.
```

773 \setlength\tabcolsep {6\p0}

\arrayrulewidth The width of rules in the array and tabular environments is given by \arrayrulewidth.

774 \setlength\arrayrulewidth{.4\p0}

\doublerulesep The space between adjacent rules in the array and tabular environments is given by \doublerulesep.

775 \setlength\doublerulesep {2\p@}

#### 7.5.2 Tabbing

\tabbingsep This controls the space that the \' command puts in. (See LATEX manual for an explanation.)

> 776 \setlength\tabbingsep {\labelsep}

#### 7.5.3 Minipage

\@minipagerestore

The macro \@minipagerestore is called upon entry to a minipage environment to set up things that are to be handled differently inside a minipage environment. In the current styles, it does nothing.

\@mpfootins Minipages have their own footnotes; \skip\@mpfootins plays same rôle for footnotes in a minipage as \skip\footins does for ordinary footnotes.

777  $\ship\0mpfootins = \ship\footins$ 

#### 7.5.4 Framed boxes

The space left by \fbox and \framebox between the box and the text in it. \fboxsep

\fboxrule The width of the rules in the box made by \fbox and \framebox.

778 \setlength\fboxsep {3\p0} 779 \setlength\fboxrule{.4\p0}

#### 7.5.5 Equation and equarray

\theequation The equation counter will be reset at beginning of a new chapter and the equation number will be prefixed by the chapter number.

> This code must follow the \chapter definition, or more exactly the definition of the chapter counter.

780  $\langle +refart \rangle \land renewcommand \land the equation \{ \c @equation \}$ 

781 (\*refrep)

782 \@addtoreset{equation}{chapter}

783 \renewcommand\theequation

784 {\ifnum \c@chapter>\z@ \thechapter.\fi \@arabic\c@equation}

785 (/refrep)

\jot \jot is the extra space added between lines of an equarray environment. The default value is used.

786 % \setlength\jot{3pt}

\Ceqnnum The macro \Ceqnnum defines how equation numbers are to appear in equations. Again the default is used.

787 % \def\@eqnnum{(\theequation)}

# 7.6 Floating objects

The file latex.dtx only defines a number of tools with which floating objects can be defined. This is done in the document class. It needs to define the following macros for each floating object of type TYPE (e.g., TYPE = figure).

\fps@TYPE The default placement specifier for floats of type TYPE.

\ftype@TYPE The type number for floats of type TYPE. Each TYPE has associated a unique positive TYPE number, which is a power of two. E.g., figures might have type number 1, tables type number 2, programs type number 4, etc.

\ext@TYPE The file extension indicating the file on which the contents list for float type TYPE is stored. For example, \ext@figure = 'lof'.

\fnum@TYPE A macro to generate the figure number for a caption. For example, \fnum@TYPE == 'Figure \thefigure'.

 $\mbox{\ensuremath{\mbox{0makecaption}}} \langle \mbox{\ensuremath{\it num}} \rangle \langle \mbox{\ensuremath{\it text}} \rangle$  A macro to make a caption, with  $\langle \mbox{\it num} \rangle$  the value produced by  $\mbox{\ensuremath{\mbox{1num}\mbox{0makecaption}}}$ , and  $\mbox{\ensuremath{\it text}} \rangle$  the text of the caption. It can assume it's in a  $\mbox{\ensuremath{\mbox{num}\mbox{0makecaption}}}$  of the appropriate width. This will be used for all floating objects.

The actual environment that implements a floating object such as a figure is defined using the macros \@float and \end@float, which are defined in latex.dtx.

An environment that implements a single column floating object is started with  $\ensuremath{\tt Qfloat{TYPE}[\langle placement\rangle]}$  of type TYPE with  $\langle placement\rangle$  as the placement specifier. The default value of  $\langle PLACEMENT\rangle$  is defined by  $\ensuremath{\tt YfpsQTYPE}$ .

The environment is ended by  $\end@float.$  E.g.,  $\figure == \@floatfigure, \endfigure == \end@float.$ 

## **7.6.1** Figure

Here is the implementation of the figure environment.

\coefigure First we have to allocate a counter to number the figures. In the report and book document classes the figures are numbered per chapter.

```
\ftype@figure 797 \def\fps@figure{tbp}
  \ext@figure 798 \def\ftype@figure{1}
 \num@figure 799 \def\ext@figure{lof}
              800 \def\fnum@figure{\figurename~\thefigure}
       figure Here is the definition of the actual environment. The form with the * is used for
      figure* double column figures.
              801 \newenvironment{figure}
                                 {\@float{figure}}
              802
              803
                                  {\end@float}
              804 \newenvironment{figure*}
              805
                                  {\@dblfloat{figure}}
              806
                                  {\end@dblfloat}
               7.6.2 Table
               Here is the implementation of the table environment. It is very much the same as
               the figure environment.
     \c@table First we have to allocate a counter to number the tables. In the report and book
               document classes the tables are numbered per chapter.
              807 (*refart)
              808 \newcounter{table}
              809 \renewcommand\thetable{\@arabic\c@table}
              810 (/refart)
              811 (*refrep)
              812 \newcounter{table}[chapter]
              813 \renewcommand\thetable%
                       {\ifnum \c@chapter>\z@ \thechapter.\fi \@arabic\c@table}
              815 (/refrep)
   \fps@table Here are the parameters for the floating objects of type 'table'.
\ftype@table 816 \det fps@table{tbp}
   \ext@table 817 \def\ftype@table{2}
   \num@table 818 \def\ext@table{lot}
              819 \def\fnum@table{\tablename~\thetable}
        table Here is the definition of the actual environment. The form with the * is used for
       table* double column tables.
              820 \newenvironment{table}
                                 {\@float{table}}
              821
                                 {\end@float}
              822
              823 \newenvironment{table*}
```

\fps@figure Here are the parameters for the floating objects of type 'figure'.

{\@dblfloat{table}}

{\end@dblfloat}

824

825

#### 7.6.3 Captions

\@makecaption

The \caption command calls \@makecaption to format the caption of floating objects. It gets two arguments,  $\langle number \rangle$ , the number of the floating object and  $\langle text \rangle$ , the text of the caption. Usually  $\langle number \rangle$  contains a string such as 'Figure 3.2'. The macro can assume it is called inside a \parbox of right width, with \normalsize.

\abovecaptionskip These leads to belowcaptionskip caption.

These lengths contain the amount of whitespace to leave above and below the caption.

```
826 \newlength\abovecaptionskip
827 \newlength\belowcaptionskip
828 \setlength\abovecaptionskip{10\p@}
829 \setlength\belowcaptionskip{0\p@}
```

The definition of this macro is \long in order to allow more then one paragraph in a caption.

```
830 \long\def\@makecaption#1#2{%
831 \vskip\abovecaptionskip
```

We want to see if the caption fits on one line on the page, therefore we first typeset it in a temporary box.

```
832 \sbox\@tempboxa{#1: #2}%
```

We can the measure its width. If that is larger than the current **\hsize** we typeset the caption as an ordinary paragraph.

```
833 \ifdim \wd\@tempboxa >\hsize

834 #1: #2\par

If the caption fits, we center it.

835 \else
836 \global \@minipagefalse
837 \hb@xt@\hsize{\hfil\box\@tempboxa\hfil}%

838 \fi

839 \vskip\belowcaptionskip}
```

# 7.7 Font changing

Here we supply the declarative font changing commands that were common in LATEX version 2.09 and earlier. These commands work in text mode and in math mode. They are provided for compatibility, but one should start using the \text... and \math... commands instead. These commands are defined using \@newfontswitch, a command with three arguments: the user command to be defined; LATEX commands to execute in text mode and LATEX commands to execute in math mode.

\rm The commands to change the family. When in compatibility mode we select the \tt 'default' font first, to get LATEX2.09 behviour.

\sf 840 \DeclareOldFontCommand{\rm}{\normalfont\rmfamily}{\mathrm}

```
841 \DeclareOldFontCommand{\sf}{\normalfont\sffamily}{\mathsf}
842 \DeclareOldFontCommand{\tt}{\normalfont\ttfamily}{\mathtt}
```

\bf The command to change to the bold series. One should use \mdseries to explicitly switch back to medium series.

```
843 \label{lem:second} $$ \Delta \Delta \operatorname{Command} \left( bf \right) {\operatorname{Command} \left( bf \right) } $$
```

\s1 Here are the commands to change the shape of the font. The slanted and small \it caps shapes are not available by default as math alphabets, so those changes do nothing in math mode. One should use \upshape to explicitly change back to the upright shape.

```
844 \DeclareOldFontCommand{\it}{\normalfont\itshape}{\mathit} 
845 \DeclareOldFontCommand{\sl}{\normalfont\slshape}{\@nomath\sl} 
846 \DeclareOldFontCommand{\sc}{\normalfont\scshape}{\@nomath\sc}
```

\cal The commands \cal and \mit should only be used in math mode, outside math mode they have no effect. Currently the New Font Selection Scheme defines these commands to generate warning messages. Therefore we have to define them 'by hand'.

```
847 \DeclareRobustCommand*{\cal}{\@fontswitch\relax\mathcal} 848 \DeclareRobustCommand*{\mit}{\@fontswitch\relax\mathnormal}
```

# 8 Cross Referencing

# 8.1 Table of Contents, etc.

A \section command writes a \contentsline{section}{ $\langle title \rangle$ }{ $\langle page \rangle$ } command on the .toc file, where  $\langle title \rangle$  contains the contents of the entry and  $\langle page \rangle$  is the page number. If sections are being numbered, then  $\langle title \rangle$  will be of the form \numberline{ $\langle num \rangle$ }{ $\langle heading \rangle$ } where  $\langle num \rangle$  is the number produced by \thesection. Other sectioning commands work similarly.

```
A \caption command in a 'figure' environment writes \contentsline{figure}{\numberline{\langle num \rangle}{ \langle caption \rangle}}{\langle page \rangle} on the .lof file, where \langle num \rangle is the number produced by \thefigure and \langle caption \rangle is the figure caption. It works similarly for a 'table' environment.
```

The command \contentsline{ $\langle name \rangle$ } expands to \lambda( $\langle name \rangle$ ). So, to specify the table of contents, we must define \lambda(chapter, \lambda(esection, \lambda(esection, \lambda)) is specify the list of figures, we must define \lambda(esection, \lambda) on. Most of these can be defined with the \Odottedtocline command, which works as follows. \Odottedtocline{ $\langle level \rangle$ }{ $\langle indent \rangle$ }{ $\langle indent \rangle$ }{ $\langle numwidth \rangle$ }{ $\langle title \rangle$ }{ $\langle page \rangle$ }

 $\langle level \rangle$  An entry is produced only if  $\langle level \rangle <=$  value of the tocdepth counter. Note, \chapter is level 0, \section is level 1, etc.

 $\langle indent \rangle$  The indentation from the outer left margin of the start of the contents line.

 $\langle numwidth \rangle$  The width of a box in which the section number is to go, if  $\langle title \rangle$ includes a \numberline command.

\@pnumwidth \@tocrmarg \@dotsep This command uses the following three parameters, which are set with a \newcommand (so em's can be used to make them depend upon the font).

\@pnumwidth The width of a box in which the page number is put.

\@tocrmarg The right margin for multiple line entries. One wants \@tocrmarg ≥ \@pnumwidth

\@dotsep Separation between dots, in mu units. Should be defined as a number like 2 or 1.7

```
849 \newcommand\@pnumwidth{1.55em}
  850 \newcommand\@tocrmarg {2.55em}
851 \newcommand\@dotsep
852 \(\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\rightarrow\righ
853 \langle +refrep \rangle \setminus setcounter\{tocdepth\}\{2\}
```

#### 8.1.1 **Table of Contents**

\tableofcontents

This macro is used to request that LATEX produces a table of contents. In the report and book document classes the tables of contents, figures, etc. are always set in single-column style.

```
854 \newcommand\tableofcontents{%
855 (*refrep)
856
        \if@twocolumn
857
          \@restonecoltrue\onecolumn
858
859
          \@restonecolfalse
860
```

The title is set using the \chapter\* command, making sure that the running head -if one is required- contains the right information.

```
\chapter*{\contentsname
861
862 (/refrep)
863 (+refart)
                \section*{\contentsname
            \@mkboth{\contentsname}{\contentsname}}%
```

The the actual table of contents is made by calling \@starttoc{toc}. After that, we restore twocolumn mode if necessary.

```
\@starttoc{toc}%
865
        \if@restonecol\twocolumn\fi
866
       }
867
```

\left(1@part Each sectioning command needs an additional macro to format its entry in the table of contents, as described above. The macro for the entry for parts is defined in a special way.

First we make sure that if a page break should occur, it occurs *before* this entry. Also a little whitespace is added and a group begun to keep changes local.

```
868 \newcommand*\l@part[2]{%

869 \ifnum \c@tocdepth >-2\relax

870 \langle+refart\rangle \addpenalty\@secpenalty

871 \langle+refrep\rangle \addpenalty{-\@highpenalty}%

872 \addvspace{2.25em \@plus\p@}%

873 \begingroup
```

The we set \parindent to 0pt and use \rightskip to leave enough room for the page numbers. To prevent overfull box messages the \parfillskip is set to a negative value.

```
874 \parindent \z@\rightskip \@pnumwidth
875 \parfillskip -\@pnumwidth
```

Now we can set the entry, in a large bold font. We make sure to leave vertical mode, set the part title and add the page number, set flush right.

```
876 {\leavevmode
877 \large \bfseries #1\hfil \hbox to\@pnumwidth{\hss #2}}\par
```

Prevent a page break immediately after this entry, but use \everypar to reset the \if@nobreak switch. Finally we close the group.

\lambda This macro formats the entries in the table of contents for chapters. It is very similar to \lambda Qpart

First we make sure that if a page break should occur, it occurs *before* this entry. Also a little whitespace is added and a group begun to keep changes local.

```
883 (*refrep)
884 \newcommand*\l@chapter[2]{%
885 \ifnum \c@tocdepth >\m@ne
886 \addpenalty{-\@highpenalty}%
887 \vskip 1.0em \@plus\p@
```

The macro \numberline requires that the width of the box that holds the part number is stored in LATEX's scratch register \@tempdima. Therefore we put it there. We begin a group, and change some of the paragraph parameters.

```
888 \setlength\@tempdima{1.5em}%
889 \begingroup
890 \parindent \z@ \rightskip \@pnumwidth
891 \parfillskip -\@pnumwidth
```

Then we leave vertical mode and switch to a bold font.

```
892 \leavevmode \bfseries
```

Because we do not use \numberline here, we have do some fine tuning 'by hand', before we can set the entry. We discourage but not disallow a page break immediately after a chapter entry.

```
\advance\leftskip\@tempdima
893
        \hskip -\leftskip
894
       1\ \nobreak\hfil \nobreak\hb@xt@\@pnumwidth{\hss #2}\par
895
        \penalty\@highpenalty
896
       \endgroup
897
898
     \{fi\}
899 (/refrep)
```

\lessetion In the article document class the entry in the table of contents for sections looks much like the chapter entries for the report and book document classes.

> First we make sure that if a page break should occur, it occurs before this entry. Also a little whitespace is added and a group begun to keep changes local.

```
900 (*refart)
901 \newcommand*\l@section[2]{%
    902
      \addpenalty\@secpenalty
903
      \addvspace{1.0em \@plus\p@}%
```

The macro \numberline requires that the width of the box that holds the part number is stored in LATEX's scratch register \@tempdima. Therefore we put it there. We begin a group, and change some of the paragraph parameters.

```
\setlength\@tempdima{1.5em}%
905
       \begingroup
906
       \parindent \z@ \rightskip \@pnumwidth
907
       \parfillskip -\@pnumwidth
908
```

Then we leave vertical mode and switch to a bold font.

```
\leavevmode \bfseries
```

Because we do not use \numberline here, we have do some fine tuning 'by hand', before we can set the entry. We discourage but not disallow a page break immediately after a chapter entry.

```
\advance\leftskip\@tempdima
910
911
        \hskip -\leftskip
       1\ \nobreak\hfil \nobreak\hb@xt@\@pnumwidth{\hss #2}\par
912
913
       \endgroup
914 \fi}
915 (/refart)
```

In the report and book document classes the definition for \losection is much simpler.

```
916 (*refrep)
917 \newcommand*\l@section
                                  {\@dottedtocline{1}{1.5em}{2.3em}}
918 (/refrep)
```

**\l0subsubsection** 919 **\\*refart\** \1@paragraph

\l@subparagraph

\lambda lower level entries are defined using the macro \@dottedtocline (see above).

```
 920 \newcommand*\l@subsection {\dottedtocline{2}{1.5em}{2.3em}} 921 \newcommand*\l@subsubsection{\dottedtocline{3}{3.8em}{3.2em}} 922 \newcommand*\l@subsubsection{\dottedtocline{4}{7.0em}{4.1em}} 923 \newcommand*\l@subsubsection{\dottedtocline{5}{10em}{5em}} 924 \/refart 925 \*refrep 926 \newcommand*\l@subsection {\dottedtocline{2}{3.8em}{3.2em}} 927 \newcommand*\l@subsection{\dottedtocline{3}{7.0em}{4.1em}} 928 \newcommand*\l@subsubsection{\dottedtocline{3}{7.0em}{4.1em}} 929 \newcommand*\l@subsubsaction{\dottedtocline{4}{10em}{5em}} 920 \/refrep \
```

#### 8.1.2 List of figures

\listoffigures This macro is used to request that LATEX produces a list of figures. It is very similar to \tableofcontents.

```
931 \newcommand\listoffigures{%
932 \langle *refrep \rangle
        \if@twocolumn
933
           \@restonecoltrue\onecolumn
934
935
        \else
           \@restonecolfalse
936
937
        \chapter*{\listfigurename
938
939 (/refrep)
940 (+refart)
                 \section*{\listfigurename
941
           \@mkboth{\listfigurename}%
                    {\listfigurename}}%
942
        \@starttoc{lof}%
943
944 \langle +refrep \rangle
                 \if@restonecol\twocolumn\fi
```

\lambda This macro produces an entry in the list of figures.

946 \newcommand\*\l@figure{\@dottedtocline{1}{1.5em}{2.3em}}

# 8.1.3 List of tables

\listoftables This macro is used to request that LATEX produces a list of tables. It is very similar to \tableofcontents.

```
947 \newcommand\listoftables{%
948 (*refrep)
        \if@twocolumn
949
950
           \@restonecoltrue\onecolumn
951
        \else
           \@restonecolfalse
952
953
        \fi
        \chapter*{\listtablename
955 (/refrep)
956 \langle +refart \rangle
                 \section*{\listtablename
```

```
957 \@mkboth{\listtablename}{\listtablename}}%

958 \@starttoc{lot}%

959 \+refrep\ \if@restonecol\twocolumn\fi

960 }
```

\10table This macro produces an entry in the list of tables.

961 \let\l@table\l@figure

# 8.2 Bibliography

\bibindent The "open" bibliography format uses an indentation of \bibindent.

```
962 \newdimen\bibindent
963 \bibindent=1.5em
```

thebibliography

The 'thebibliography' environment executes the following commands:

 $\label{lem:command} $$\operatorname{\ensuremath{\colored}}$- Defines the "closed" format, where the blocks (major units of information) of an entry run together.$ 

\sloppy - Used because it's rather hard to do line breaks in bibliographies, \sfcode'\.=1000\relax - Causes a '.' (period) not to produce an end-of-sentence space.

The implementation of this environment is based on the generic list environment. It uses the *enumiv* counter internally to generate the labels of the list.

When an empty 'thebibliography' environment is found, a warning is issued.

```
964 \newenvironment{thebibliography}[1]
965~\langle + \mathsf{refart} \rangle
                 {\section*{\refname
966 \langle +refart \rangle
                      \@mkboth{\refname}{\refname}}%
967 (+refrep)
                  {\chapter*{\bibname
968 (+refrep)
                      \@mkboth{\bibname}{\bibname}}%
969
          \list{\@biblabel{\@arabic\c@enumiv}}%
970
                {\settowidth\labelwidth{\@biblabel{#1}}%
                 \leftmargin\labelwidth
971
                 \advance\leftmargin\labelsep
972
                 \@openbib@code
973
974
                 \usecounter{enumiv}%
975
                 \let\p@enumiv\@empty
976
                 \renewcommand\theenumiv{\@arabic\c@enumiv}}%
977
                 \sloppy
                 \clubpenalty4000
978
                 \@clubpenalty \clubpenalty
979
                 \widowpenalty4000%
980
          \sfcode'\.=\@m
981
         {\def\@noitemerr
982
           {\@latex@warning{Empty 'thebibliography' environment}}%
983
984
          \endlist}
```

\newblock The default definition for \newblock is to produce a small space.

985 \newcommand\newblock{\hskip .11em\@plus.33em\@minus.07em}

\CopenbibCcode The default definition for \CopenbibCcode is to do nothing. It will be changed by the openbib option.

986 \let\@openbib@code\@empty

\@biblabel The label for a \bibitem[...] command is produced by this macro. The default from latex.dtx is used.

```
987 % \renewcommand*{\@biblabel}[1]{[#1]\hfill}

1025
                                  {\indexname}%
1026
                        \parindent\z@
1027
1028
                        \parskip\z@ \@plus .3\p@\relax
                        \let\item\@idxitem}
1029
```

When the document continues after the index and it was a one column document we have to switch back to one column after the index.

```
1030 {\end{fullpage}\if@restonecol\onecolumn\else\clearpage\fi}
```

\@idxitem Thsee macros are used to format the entries in the index.

```
\label{local_subitem} $$ \sum_{1031 \neq 1032} \end{\colored} $$ {\scriptstyle 0idxitem \leq 40\p0} $$ 1033 \end{\colored} $$ 1030 \end{\colored} $$ \end{\colored} $$ \end{\colored} $$ 1030 \end{\colored} $$ \end{\colored} $$
```

\indexspace The amount of whitespace that is inserted between 'letter blocks' in the index.

1034 \newcommand\indexspace{\par \vskip 10\p@ \@plus5\p@ \@minus3\p@\relax}

#### 8.4 Footnotes

\footnoterule

Usually, footnotes are separated from the main body of the text by a small rule. This rule is drawn by the macro \footnoterule. We have to make sure that the rule takes no vertical space (see plain.tex) so we compensate for the natural height of the rule of 0.4pt by adding the right amount of vertical skip.

To prevent the rule from colliding with the footnote we first add a little negative vertical skip, then we put the rule and make sure we end up at the same point where we begun this operation.

```
1035 \renewcommand\footnoterule{%

1036 \kern-3\p0

1037 \hrule\@width.4\columnwidth

1038 \kern 2.6\p0}
```

\c@footnote Footnotes are numbered within chapters in the report and book document styles.

```
1039 % \newcounter{footnote}
1040 \langle + \text{refrep} \ \mathreaddtoreset{footnote} \{ chapter \}
```

\@makefntext

The footnote mechanism of IATEX calls the macro \@makefntext to produce the actual footnote. The macro gets the text of the footnote as its argument and should use \@thefnmark as the mark of the footnote. The macro \@makefntextis called when effectively inside a \parbox of width \columnwidth (i.e., with \hsize = \columnwidth).

An example of what can be achieved is given by the following piece of TEX code.

The effect of this definition is that all lines of the footnote are indented by 10pt, while the first line of a new paragraph is indented by 1em. To change these dimensions, just substitute the desired value for '10pt' (in both places) or '1em'. The mark is flushright against the footnote.

In these document classes we use a simpler macro, in which the footnote text is set like an ordinary text paragraph, with no indentation except on the first line of a paragraph, and the first line of the footnote. Thus, all the macro must do is set \parindent to the appropriate value for succeeding paragraphs and put the proper indentation before the mark.

```
1041 \long\def\@makefntext#1{%

1042 \@setpar{\@opar

1043 \@tempdima = \hsize

1044 \advance\@tempdima -1em

1045 \parshape \@ne 1em \@tempdima}%

1046 \par\parindent 1em \noindent

1047 \hb@xt@\z@{\hss\@textsuperscript{\normalfont\@thefnmark}\,}#1}
```

\Cmakefnmark The footnote markers that are printed in the text to point to the footnotes should be produced by the macro \Cmakefnmark. We use the default definition for it.

 $1048 \label{locality} $$1048 \label{locality} $$ 1048 \label{locality$ 

### 9 New commands

\Caddmarginpar Redefine the \Caddmarginpar command to only use the left margin.

```
1049 \def\@addmarginpar{\@next\@marbox\@currlist{\@cons\@freelist\@marbox
        \@cons\@freelist\@currbox}\@latexbug\@tempcnta\@ne

1084
```

# 9.1 Margin commands

\marginlable \seealso \attention \attentionsymbol

This defines three commands to put information in the margin: \marginlabel buts the argument into a flush right marginpar, \attention puts \attention symbol to the left of the text to mark an important piece of text and \see also puts a  $\rightarrow$  to the left of the margin to mark a reference within the text. \attentionsymbol is defined as !  $\rightarrow$  but can be changed with a \renewcommand{\attentionsymbol}{:-)} command.

#### 9.2 Rules

\longrule These rules are used in several places, like the title, new parts and chapters and \longthickrule for maxi- and fullpages.

# 9.3 Pages

maxipage
fullpage

The \maxipage is a minipage which uses the full width of the page with optional rules on the top and bottom. A maxipage can not split over pages. You can use it for wide tables, long math equations and the like. It can be used in floats.

The \fullpage changes the page layout such that normal text and all environments use the full width of the page. Inside the \fullpage-environment, the \leftmarginwidth is reset to 0, thus it is possible to start a new chapter inside a \fullpage. This will be used in the index.

```
1096 \newenvironment{maxipage}{\par
1097
                    \mbox{}\kern-\leftmarginwidth %\kern-\@totalleftmargin
1098
                    \begin{minipage}{\fullwidth}
                      \medskip \ifmaxipagerule \hrule\medskip \fi
1099
1100
                      \parskip = 0.5\baselineskip
1101
                      \def\marginpar{%
1102 (+refart)
                              \ClassError{Refart}
1103 (+refrep)
                               \ClassError{Refrep}
1104
                      {Marginpar not allowed within Maxipage.}
1105
                      {Where should I put them?\MessageBreak
1106
                       I'm using the full pagewidth.}}}
1107
                    {\par \vskip\parskip
                       \medskip \ifmaxipagerule \hrule\medskip \fi
1108
1109
                     \end{minipage}\par}
1110 \newenvironment{fullpage}{%
1111
                    \clearpage
1112
                    \textwidth=\fullwidth
1113
                    \addtolength\oddsidemargin {-\leftmarginwidth}
1114
                    \setlength\evensidemargin{\oddsidemargin}
1115
                    \left| \cdot \right| = \left| z_0 \right|
1116
                    \hsize = \fullwidth
                    \linewidth=\fullwidth
1117
                    \columnwidth=\fullwidth
1118
1119
                    \def\marginpar{%
                              \ClassError{Refart}
1120 \langle +refart \rangle
1121 (+refrep)
                              \ClassError{Refrep}
1122
                      {Marginpar not allowed within Fullpage.}
1123
                      {Where should I put them? I'm already\MessageBreak
1124
                       using the whole page for text.}}}
1125
                    {\clearpage}
```

#### 9.4 Miscellaneous

\condbreak \noparskip

The \condbreak{length} controls page breaks: If less then length is left on this page it will be moved to the next page. Thus it will remain together, either on this page or on the next.

\noparskip removes the vertical parskip like \noindent removes the parindent.

```
1126 \def\condbreak#1{\vskip \z@ plus #1\pagebreak[3]\vskip \z@ plus -#1\relax}
1127 \def\noparskip{\vskip-\parskip}
```

\REF@twocolumn Since this layout does not support \twocolumn the command is disabled but saved \twocolumn in \REF@twocolumn. The saved version will be used in the index. This is still experimental! Don't rely on it in future releases.

```
1128 \let\REF@twocolumn\twocolumn
1129 \def\twocolumn{%
1130 (+refart) \ClassError{Refart}
1131 \(\right\) + refrep\\ClassError\{Refrep\}
1132 {Sorry, there is no twocolumn layout in this class}
1133 {Can you imagine how twocolumn layout will look?\MessageBreak
1134 That's why!}}
```

#### 9.5 Obsolete commands

Well, these comands are not really obsolete, but they are not implemented in this version and will not be implemented later unless there is popular demand.

\makeauthor: The author is printed when \maketitle is executed thus there is no need for this command.

\setleftmarginwidth has been used in version 1.1 to change the horizontal layout. I would prefer to set the leftmarginfraction instead but I'm still open to suggestions from users.

#### 9.6 Future commands

The following commands are not yet implemented but sound like a good idea.

\ppc \pageperchapter This gives you a page count per chapter like 1-1, 1-2, 2-1. Since this is often requested and would be usefull in a reference manual style. \pageperchapter is only supported in refrep.cls.

This version redefines the LATEX \@wrindex command which writes the indexentry. This hack is needed to keep MakeIndex happy when processing the index-file. The \ppc command is responsible to extract the chapter number from the index-entry and reformat it. The chapter number can be a Roman or Alpha number but the page has to be arabic.

```
1136 (+refrep) \newcommand{\pageperchapter}
               {\@pageperchaptertrue
1137 \langle + \text{refrep} \rangle
1138 (+refrep)
                \let\ppthepage=\thepage
1139 (+refrep)
                \renewcommand\@pnumwidth{2.55em}
1140 (+refrep)
                \@openrighttrue
1141 (+refrep)
                \renewcommand\thepage{%
1142 (+refrep)
                  1143 (+refrep)
                     \ppthepage
1144 (+refrep)
                  \else
1145 (+refrep)
                     \thechapter\ -- \arabic{page}
1146 \langle +refrep \rangle
                  \fi
```

```
1147 (+refrep)
1148 (+refrep)
                  \def\@wrindex##1{%
1149 (+refrep)
                     \protected@write\@indexfile{}%
1150 (+refrep)
1151 (+refrep)
                       {\string\indexentry{##1}{\arabic{page}}}%
1152 (+refrep)
                     \else
1153 \langle +refrep \rangle
                       \protected@write\@indexfile{}%
1154 \langle +refrep \rangle
                       {\string\indexentry{##1|ppc{\thechapter}}%
1155 (+refrep)
                       {\arabic{page}}}%
1156 (+refrep)
                     \fi
1157 (+refrep)
                     \endgroup
1158 (+refrep)
                     \@esphack
1159 (+refrep)
                     }
                     \def\ppc##1##2{##1 -- ##2}
1160 (+refrep)
1161 (+refrep)
```

\leftmarginfraction

This provides an interface to change the horizontal layout. In this version, the margin is set to 0.3 fullwidth, this may change in future versions.

# 10 Initialization

#### 10.1 Words

\contentsname This document class is for documents prepared in the English language. To prepare a version for another language, various English words must be replaced. All the English words that require replacement are defined below in command names.

```
\refname \\ \lambda \refname \\ \r
```

#### 10.2 Date

\today This macro uses the TEX primitives \month, \day and \year to provide the date of the LATEX-run.

```
1174 \def\today{\ifcase\month\or
1175    January\or February\or March\or April\or May\or June\or
1176    July\or August\or September\or October\or November\or December\fi
1177    \space\number\day, \number\year}
```

### 10.3 Two column mode

\columnsep This gives the distance between two columns in two column mode.

1178 \setlength\columnsep{10\p0}

\columnseprule This gives the width of the rule between two columns in two column mode. We have no visible rule.

1179 \setlength\columnseprule{0\p@}

# 10.4 The page style

We have *plain* pages in the document classes refart and refrep unless the user specified otherwise. We use arabic page numbers.

# 10.5 Single or double sided printing

When the twoside option wasn't specified, we don't try to make each page as long as all the others.

```
1182 \if@twoside
1183 \else
1184 \raggedbottom
1185 \fi
```

When the twocolumn option was specified we call \twocolumn to activate this mode. We try to make each column as long as the others, but call sloppy to make our life easier.

```
1186 \if@twocolumn
1187 \twocolumn
1188 \sloppy
1189 \flushbottom
```

Normally we call \onecolumn to initiate typesetting in one column.

```
1190 \else
1191 \onecolumn
1192 \fi
1193 \( / \text{refart} \ | \text{refrep} \)
```
